## **Healthcare Worker Mental Health Challenges Post-COVID**

### **Overview**

The mental health of healthcare workers was seriously stressed during the COVID-19 Pandemic (Benfante, 2020; Carmassi, 2020; Huang, 2020; Pappa, 2020). Unfortunately, the levels of burnout, anxiety, depression, and post-traumatic stress continue to affect these workers (Shalev, 2017). The mental health of this workforce was already problematic prior to the outbreak (Weinberg, 2000) and then the intensive workload, vulnerability, ethical challenges, high number of patient deaths in any given shift, loss of control, deaths of co-workers, isolation, decision load, changes to procedures, and risk to one's own and family members health amplified the mental trauma (Aram, 2022; Dong, 2020; Gambaro, 2023; Le, 2021). Even years after the pandemic was declared over, health care workers continued to show signs of emotional and psychological distress (Hill, 2022; Maunder, 2023).

### **Mental Health**

#### **Burnout**

Burnout is a symptom of emotional exhaustion. This may be attributed to the depleted healthcare workforce which has not allowed for full recovery from the accumulated impact of the extreme chronic stressors of work during the three-year arc of the pandemic (Baumann, 2023; Looi, 2024; Luceño-Moreno, 2020, 2022; Tan, 2023). Depersonalization and a diminished sense of pride and accomplishment lead to burnout by causing healthcare workers to distance themselves or withdraw from their work and patients. This begins a cycle of increasing moral distress and further depersonalization (Epstein, 2009; Maunder, 2023; Parandeh, 2022).

#### **Anxiety, Depression and Stress**

Psychological distress can exhibit as anxiety, depression, and/or stress. Studies indicate that psychological distress not only has not decreased since the end of the pandemic, but, for nurses, has increased (Hassannia, 2021; Kang, 2020; Li, 2021; Muñoz-Ortega, 2024; Newnham, 2022).

### **Current Environment**

- Healthcare workers, particularly those based in hospital settings, have not recovered from the pandemic-related effects on their mental health and emotional well-being (Maunder, 2024).
- More than double the number of health care workers reported harassment at work in 2022 than in 2018 (Nigam, 2023).

- Forty-six percent of health workers reported often feeling burned out in 2022, up from 32% in 2018 (Nigam, 2023).
- Forty-four percent of health workers intended to look for a new job in 2022, up from 33% in 2018 (Nigam, 2023).
- One in 18 nurses report having suicidal ideation in the past year (Kelsey, 2021).
- Nearly 40 % of critical care nurses studied had symptoms of depression (Melnyk, 2021).
- Sixty-five percent of nurses report burnout (CrossCountry, 2025).

### **Argument for Implementing Increased Access to Mental Health Care**

“Ongoing monitoring and support of the wellness of hospital-based healthcare workers is critical not only for individual well-being but also for the recruitment and retention of staff that is necessary for the well-being of the health care system” (Maunder, 2024).

### **Recommendations**

#### **Regulating Shifts**

Both the shift workers and the employers need to assure a healthy rotation of schedules to ensure rest, sleep, and relaxation (Muller, 2020). The current environment of twelve-hour shifts may encourage workers to feel that they can hold two full-time positions working six twelve-hour shifts a week. This is neither safe nor healthy. Studies have found that 12 hour shifts can impair driving, negatively impact patient care, increase nurse errors, and impair the physical and mental health of the nurse (Melnyk, 2025).

#### **Reducing Work-Related Stressors**

Healthcare is intrinsically a stressful environment; however, coping skills vary among healthcare workers. Studies found that individuals who focused on and implemented active problem-solving strategies suffered less stress reactions than those who used more emotional-focused coping (Gan, 2004; Main, 2011). Emotional or “negative” coping is associated with increased psychological distress (Wang, 2020). Active or “positive” coping is associated with higher levels of well-being (Budimir, 2021; Hezaveh, 2021).

Healthcare workers should be encouraged to include positive coping strategies and wellness behaviors into their daily work to reduce anxiety and depression (Naushad, 2019; Serrano-Ripoll, 2020). These strategies may include yoga, social connections, and exercise (Schulte, 2020; Smallwood, 2021).

#### **Healthy Work Environment**

A supportive work environment includes shared governance, trust, and workplace safety. Supervisors should be empowered and encouraged to promote stress reduction strategies, mental well-being, productivity, and encouragement. Time needs to be allowed to complete tasks and to rejuvenate the workers. The workplace must be free for verbal harassment and physical abuse (Nigam, 2023).

A healthy work environment includes having a non-punitive culture including for the reporting of substance abuse (Cheney, 2025). It is important for staff to feel safe identifying issues, potential problems, and errors for the highest level of care to be provided. In a safe, supportive environment, healthcare workers can re-establish a sense of pride and accountability in what they do, breaking the cycle of depersonalization and moral distress (Hatfield, 2025; Muller, 2020).

Digital support such as mobile mental health apps and telepsychiatry allow healthcare workers to access vital mental health services that can flex around work schedules and can be accessed in an unobtrusive manner (Muñoz-Ortega, 2024). Employers should be encouraged to include and normalize these support platforms in their Employee Assistance Program packages.

## **Maternal Mortality White Paper**

### **Overview**

The United States (U.S.) is a high-income, high health care spending country with one of the highest maternal mortality rates. An average of 3.8 women die from childbirth complications every day (Davidson, 2024). Counties in the United States that have been designated as “maternity care deserts” are associated with significantly higher rates of adverse maternal and pregnancy-related outcomes, including preterm births and maternal death.

### **Maternity Care Deserts**

Regions that are identified as maternity care deserts are areas lacking a hospital or birth center offering obstetric care and a lack of maternity care providers (Stoneburner, 2024). The literature also notes that, even when care may be available, the care quality in Black-serving hospitals, providers’ implicit bias, perceived racial discrimination, differential obstetric procedures, chronic conditions, and the causes and timing of maternal deaths are also factors influencing mortality rates (Davidson, 2024).

### **Maternal Deaths and Morbidity**

Maternal death is defined as “the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management, but not from accidental or incidental causes” (WHO, 2009). According to the World Health Organization (2023), the major complications of pregnancy and childbirth that account for around 75% of all maternal deaths world-wide are:

- Severe bleeding which can kill a healthy woman within hours of delivery if unattended
- Infections after childbirth which are left untreated
- Pre-eclampsia and eclampsia (high blood pressure during pregnancy)
- Complications from delivery
- Unsafe abortion

As seen above, most maternal deaths and complications are preventable. The two key elements to reducing maternal deaths are basic hygiene and the attendance of a health care professional at the birth (Roser 2013). Additionally, severe morbidity during and immediately following pregnancy increases a woman’s overall risk of mortality beyond the postpartum period.

## **Current National Environment**

“During the past 3 decades, as the U.S. maternal mortality rate has been increasing, the overall global rate of maternal mortality has declined dramatically. Other high-income countries have maternal mortality rates one third to one half of the U.S. rate” (Davidson, 2024). In addition to the overall mortality rate increasing, the disparity between groups has also increased. In 2022, the maternal mortality rate in the United States was reported (in number of deaths per 100,000 live births) as:

- Black women (49.5 deaths)
- White women (19.0 deaths)
- Hispanic women (16.9 deaths)
- Asian women (13.2 deaths)
- Women younger than 25 (14.4 deaths)
- Women aged 25-39 (21.1 deaths)
- Women aged 40 and older (87.1 deaths) (Hoyert, 2024)

For comparison, in 2015 the maternal mortality rate in the European Union was 8 deaths per 100,000 births (Roser, 2013). These inequities can be related to several social factors in place in the United States, primarily lack of paid parental leave, Medicaid pregnancy coverage limits, variable access to pre- and postpartum care and intimate partner violence (Davidson, 2024; Steele-Baser, 2024; Wallace, 2022).

## **Current New York State Environment**

Over 35% of counties in the United States are maternity care deserts. In New York State (NYS), the counties identified as care deserts are: Hamilton, Herkimer, and Wayne (Stoneburner, 2024). One of the most acute physician shortages in rural NYS is of Ob/Gyn physicians where there is roughly one Ob/Gyn physician for every 23,000 people. Hamilton, Herkimer, Schuyler, and Yates counties have no Ob/Gyn physicians (DiNapoli, 2025). The disparities identified above for the U.S. are consistent, proportionally with those in NY. Overall, the New York maternal mortality rate was 22.4 deaths per 100,000 live births during 2018-2022 (March of Dimes, 2024) ranking it 20 of 45 reporting states. The 2018-2020 statewide maternal mortality ratio for Black women was 55.8 deaths per 100,000 live births compared to White women at 13.2 deaths making the Black to White mortality ratio in NYS 4.2 to 1 (NYSDOH, 2023). Racial discrimination was a factor in 50% of these deaths.

With current federal budget changes, it is anticipated that small, regional hospitals may close, causing an expansion of the number of maternity care deserts (Luthra, 2025). When compared to women living in urban areas, women living in rural areas have a 9% increased probability for severe maternal mortality and morbidity (Kozhimannil, 2019).

### **Argument for Implementing full Practice Authority for Advanced Practice Nurses (Nurse Midwives, Women’s Health Nurse Practitioners, Women’s Health Clinical Nurse Specialists, Certified Registered Nurse Anesthetists)**

Imbalanced geographic distribution of health care providers, in this case maternity care providers, has created these care deserts. The imbalance is most noticeable in rural and low-resourced settings where the Nurse Practitioner to 10,000 population ratio is significantly lower than the rest of the state (DiNapoli, 2025). Qualified, well-educated nurses can provide care before, during, and after childbirth in these underserved areas improving care outcomes. The integration of midwives has been shown to decrease c-section rates and improve neonatal outcomes (Vedam, 2018). Telehealth and shared mobile units can also help to supplement care in these areas (Atwani, 2025). “Given the increased reliance on Nurse Practitioners for primary care, and the expansion of Nurse Practitioner’s scope of practice to allow them to practice medicine without the oversight of a physician, there may be an opportunity to establish educational pipelines to upskill across the nursing spectrum” (DiNapoli, 2025).

"Full practice authority and equitable reimbursement for all advanced practice nurses increases access to perinatal care, enhances childbearing women’s options for pregnancy and birth care, and promotes culturally congruent care with a variety of perinatal providers. Optimizing perinatal nurses and APRNs' roles would also enhance access to and quality of care in perinatal care deserts. Furthermore, by promoting supportive practice environments with unfettered practice laws, culturally congruent care models can flourish and mitigate long-standing disparities in perinatal outcomes” (Bradford, 2025).

### **Recommendations**

Davidson (2024) reports on a National Institute of Health (NIH) consensus panel report that lays out a maternal morbidity and mortality prevention moonshot which includes resources, commitment, and a focus on equity in the areas of prevention, public health, research, and health care access and quality to reduce maternal death and equitably promote maternal health. Educational pipelines should be created to provide more opportunities to the existing and expanding healthcare workforce to develop their skills, in parallel with efforts to attract and retain more healthcare professionals to underserved areas (DiNapoli, 2025).
